Sinopec, the Chinese oil & gas company that is the world's fifth largest company by revenue, recently completed a successful winter study from October 2012 to March 2013 with Nansulate® High Heat coating for insulation and corrosion control.

they were using and one that would prevent corrosion, which was being caused by the rock wool.

Nansulate® provided them with an effective solution in a clear thin film application that also prevented corrosion.

Sinopec was looking for a better solution than the rock wool insulation

A 12-coat application of Nansulate® was used over the offshore fuel oil storage tank stationed in the East China Sea. The tank had to be kept between 68C and 72C. The final analysis showed that Nansulate was effective and within 3 degrees C of the 8cm rock wool insulation, plus it solved the corrosion issue and provided a cost effective solution that

would stand up to the harsh ocean environment without degrading.

Nansulate® provided Sinopec with a better solution for insulation and corrosion control of their fuel storage tanks, which lasts much longer than other insulation options, which greatly reduces the maintenance and replacement costs over time.
